BioOne Complete (complete.BioOne.org) is a full-text database of 200 subscribed and open-access titles in the biological, ecological, and environmental sciences published by nonprofit societies, associations, museums, institutions, and presses.

Your use of this PDF, the BioOne Complete website, and all posted and associated content indicates your acceptance of BioOne's Terms of Use, available at www.bioone.org/terms-of-use.

Usage of BioOne Complete content is strictly limited to personal, educational, and non - commercial use. Commercial inquiries or rights and permissions requests should be directed to the individual publisher as copyright holder.

BioOne sees sustainable scholarly publishing as an inherently collaborative enterprise connecting authors, nonprofit publishers, academic institutions, research libraries, and research funders in the common goal of maximizing access to critical research.

PER G. P. ERICSON¹

Department of Vertebrate Zoology, Swedish Museum of Natural History, P.O. Box 50007,
SE-10405 Stockholm, Sweden

Ericson et al. (2000) reported on the taxonomic distributions of two insertions in the nuclear *c-myc* gene observed in a survey of passerine species. On the basis of an expanded set of sequences, it has become evident that the most parsimonious placement for the first insertion is between positions 789 and 790 in the published chicken (*Gallus*) sequence (Watson et al. 1983). The positional change of this insertion does not affect the phylogenetic interpretation of its occurrence. We thank Michael J. Braun and John Harshman for alerting us to the possibility that the insertion should be located at a different position than was first suggested.
