Carex cespitosa: reappraisal of its distribution in Europe

Abstract

Jiménez-Mejías P., Hilpold A., Frajman B., Pușcaș M., Koopman J., Mesterházy A., Grulich V., Lye K. A. & Martín-Bravo S.: *Carex cespitosa*: reappraisal of its distribution in Europe. – Willdenowia 44: 327–343. 2014. – Version of record first published online on 31 October 2014 ahead of inclusion in December 2014 issue; ISSN 1868-6397; © 2014 BGBM Berlin-Dahlem.

DOI: <http://dx.doi.org/10.3372/wi.44.44303>

Carex cespitosa L. (*Cyperaceae*) has been traditionally regarded as widespread in Europe, being reported from most countries. However, its distribution is currently overestimated due to the ambiguous use of the name *C. cespitosa*, together with frequent taxonomic confusion, mainly with the closely related *C. elata* All. and *C. nigra* (L.) Reichard. We present a critical revision of the distribution of *C. cespitosa* in Europe W of the former USSR, based on herbarium material and literature. We confirm the presence of the species in 19 European countries, while its occurrence is considered as doubtful in another five countries. Data pertinent to the ecology and conservation status of the species in the different countries are also provided. It is considered threatened or nearly so in at least eight countries. Hybrids with *C. acuta* L., *C. elata* and *C. nigra* are morphologically characterized and discussed. Although chorological revisions of the European flora are commonly considered of relatively minor scientific relevance, the situation detected by our survey of *C. cespitosa* reveals the importance of, and need for, these basic works for the accurate knowledge of many species, especially for subsequent works on conservation biology and biogeography.

Additional key words: “*Carex caespitosa*”, chorology, conservation, endangered flora, hybrids

Introduction

Carex cespitosa L. (misspelled as “*caespitosa*” in many works) is the type species of *C. sect. Phacocystis* Dumort. (Egorova 1999), one of the largest sections of the genus *Carex* L. (*Cyperaceae*) with approximately 90 species distributed worldwide (Dragon & Barrington 2008). Taxa belonging to *C. sect. Phacocystis* are characterized morphologically by oblong to cylindrical female spikes,

two stigmas and lenticular, frequently papillose, short-beaked utricles (Chater 1980; Egorova 1999; Luceño & Jiménez-Mejías 2008). The taxonomy of *C. sect. Phacocystis* is complex mainly due to hybridization processes and the faint morphological boundaries among many taxa (see Stoeva & al. 2005; Nakamatte & Lye 2007; Jiménez-Mejías & al. 2014). Many studies based on morphological and/or molecular data have contributed to elucidate the intricate relationships among its members in Europe

(e.g. Faulkner 1972; Luceño & Aedo 1994; Stoeva & al. 2005; Wallnöfer 2006; Nakamatte & Lye 2007; Dean & Ashton 2008; Schönswetter & al. 2008; Jiménez-Mejías & al. 2011; Košnar & al. 2012; Jiménez-Mejías & al. 2012, 2014).

Carex cespitosa is widely distributed across the Palearctic (Egorova 1999), from the Iberian Peninsula (Jiménez-Mejías & al. 2007) to Japan (Ohwi 1965). In Europe, it becomes scarce towards S Mediterranean countries (Chater 1980), and it is absent from Africa (cf. Maire 1957). It comprises two subspecies; the typical one occurring across the whole range of the species except for E Siberia and Japan, where it is replaced by *C. cespitosa* subsp. *minuta* (Franch.) Vorosch. (Egorova 1999). The species is distinguished from related taxa by the entire scale-like reddish-purplish basal sheaths, epistomatic leaves, the lowermost bract shorter than the inflorescence, an inflorescence composed of 1 male spike and (1 or)2(or 3) female spikes of c. 30 mm length, and nerveless utricles (Chater 1980; Egorova 1999; Luceño & Jiménez-Mejías 2008; Fig. 1). *Carex cespitosa* is known to inhabit semi-terrestrial wet environments (Schultze-Motel 1968; Chater 1980), specifically wet meadows (Hájková & Hájek 2007; James & al. 2011) and peat bogs (Zajac & Zajac 2001), although it can also be found along river shores (De Boer 1974; Jiménez-Mejías & al. 2007).

Despite the fact that chorological revision works are frequently neglected and considered of minor relevance, the accuracy of such data is critical for phylogeographic and conservation biology studies. The actual distribution of *Carex cespitosa* in Europe has been greatly obscured, mainly due to: (1) the traditional use of the Linnaean binomial to refer to a wide array of tussock-forming plants within *C. sect. Phacocystis*, mainly corresponding to *C. elata* All. and tussocky forms of *C. nigra* (L.) Reichard (see Results); (2) the complex taxonomy of the section, historically characterized by many successive taxonomic rearrangements, nomenclatural changes and misidentifications; and (3) hybridization between members of the section, which blurs taxonomic boundaries. After a thorough herbarium revision and an extensive bibliographic survey, the distribution of *C. cespitosa* in Europe, W of the former USSR, is reappraised, the detected hybrids are listed and morphologically characterized, and the conservation status of the species in different European countries is revised.

Material and methods

A total of 251 vouchers (284 herbarium specimens) of *Carex cespitosa* and its hybrids were studied from the following 45 herbaria: ARAN, B, BASBG, BBF, BM, BP, BREM, BRNU, BVS, C, CHE, CL, DE, G, GJO, HEID, HOMP, IAGB, JE, K, KRA, L, LI, LISU, M, MA, NLH, O, P, PR, PRC, ROZ, SALA, SAMU, SANT, SIB, SOM, STU, THR, UPOS, UPS, W, WA, WU and ZT.

Additional searches were carried out in BEO, BEOU, BERG, BOLO, BOZ, BUCA, BUNS, CRAI, FI, GDOR, GE, I, IASI, LJU, MSB, MSNM, PA, RO, ROV, SARA, SO, TO and UUV, but no material belonging to *C. cespitosa* was found. Among these herbaria, BEO, BEOU, BM, BUNS, FI, K, LJU, M, MA, MSB, RO, SO, SOM, TO and UPOS were visited in situ and their collections exhaustively checked. Previous reports of the species in the study area in Floras, checklists and chorological notes were critically revised (see sources for each country under Results). A special effort was made to exhaustively revise the W and S parts of the European distribution of the species, where it has been confused or has remained long unnoticed. Due to the extensive and relatively well-known distribution of *C. cespitosa* in Finland, Sweden, and Poland (see Results), the chorological revision in these three countries was not so intense as in the rest of the area. The conservation status of the species (see IUCN 2012 for the definition of the conservation categories) was checked in the corresponding national Red List for each country, if available.

Results and Discussion

The distribution of *Carex cespitosa* in Europe W of the former USSR, based on herbarium records and reliable bibliographic data, is shown in Fig. 2 and Table 1. No vouchers or literature evidence were found for the occurrence of *C. cespitosa* in Belgium, Greece, Iceland, Ireland, Luxembourg, Macedonia, Malta, Portugal and European Turkey. Specimens studied are listed by country in Appendix 1.

1. Distribution

Albania

Carex cespitosa has recently been found in a single location during fieldwork in the NE part of the country, near the Kosovan border (Barina & al. 2011).

Austria

Citations in Austria before the late 19th century are not reliable, since the species was frequently misidentified as either *Carex nigra* or *C. elata* (cf. Ortmann 1854). The species is relatively frequent close to the Austrian-Czech border in Lower Austria, at the E limit of the Bohemian Massif (Waldviertel district; Janchen 1977; Grulich & Chytrý 1993). In the rest of Austria, *C. cespitosa* is restricted to very few localities, mainly in the E regions of the country. It is absent from the two westernmost provinces, Tyrol and Vorarlberg (Fischer & al. 2008). For the Salzburg region only a single population, bordering the Alps, is currently known (Flachgau district; Eichberger & al. 2004; Eichberger & Arming 2004). An additional population reported from nearby (Reiter 1947) might be extinct (Wittmann & al. 1996). In Upper Austria it has lately been

Fig. 1. *Carex cespitosa* representative photographs – A: basal sheaths; B: general habit; C: inflorescence with ripe utricles; D: river shore population. – A & B: Niederösterreich, Austria, photographed by C. Paschschwoell; C & D: Bidasoa River, Navarra, Spain, photographed by M. Luceño.

confirmed for the Bohemian Massif but it is considered as extinct in the lowland areas (Hohla & al. 2009). Further citations can be found for W Styria (next to Neumarkt in Steiermark; Melzer 1961, 1968), SE Styria and the nearby area of S Burgenland (Melzer 1968; Wallnöfer & al. 1991), and the nearby areas of Carinthia (Melzer 1966, 1969) – here, exceptionally, within the Alps.

The Red List of ferns and flowering plants of Austria (Niklfeld & Schratt-Ehrendorfer 1999) considers *Carex cespitosa* within category 2 (equivalent to Endangered – EN).

Bosnia and Herzegovina

We are not aware of any literature records concerning

Fig. 2. *Carex cespitosa* distribution in Europe W of the former USSR based upon our data. – A: Approximate known range in 1950 as recorded by Hultén's revision (1950). Dots indicate isolated locations. – B: Distribution according to 267 reliable records (herbarium vouchers and literature). Areas in Scandinavia and Poland, where the distribution of populations has been reported as relatively dense, are indicated by dark shading (according to Mossberg & Stenberg 2005, and Zajac & Zajac 2001, respectively). Triangles indicate reliable bibliographic references; circles indicate checked herbarium vouchers; white shapes indicate data from and before 1968 (date of publication of *Carex* in Flora von Mitteleuropa; Schultze-Motel 1968); black shapes indicate data from and after 1969; question marks depict the doubtful occurrences in Italy, Slovenia and Montenegro.

the occurrence of *Carex cespitosa* in Bosnia and Herzegovina. The identity of a herbarium voucher housed at SARA "In fossis subexsiccatis vallis Stabrova ěa prope Jelaš c. 1400 m, 8 Jul 1931, Maly (SARA)" could not be confirmed with certainty. We therefore consider its occurrence in Bosnia and Herzegovina as doubtful.

Bulgaria

There are only three confirmed records of *Carex cespitosa* in Bulgaria, two of them very close together in the Yambol region (Yornanov & al. 1974; Stoeva & al. 2005), and a third near Sofia (Hájek & al. 2007). These Bulgarian populations are the southernmost in Europe.

Despite its rarity in the country, *Carex cespitosa* is not listed on the Red List of Bulgarian vascular plants (Petrova & Vladimirov 2009).

Croatia

The only published records of *Carex cespitosa* from the current territory of Croatia are from the surroundings

of Rijeka (Rossi 1930; see also Iljanić & Topić 2000). The record published in Flora croatica (Schlosser de Klekovski & Farkaš-Vukotinović 1896) is from Zemun ("Semlin"), near Beograd, nowadays part of Serbia. Moreover, the record from Srem ("Sirmien"; Schulzer von Müggenburg & al. 1866) is likely to be from current Vojvodina in Serbia. There is no herbarium material of this species available in the main Croatian herbaria (A. Alegro, pers. comm.). However, *C. cespitosa* has recently been observed from Drežničko polje, near Drežnica village in Velika Kapela (N Dinarides), and registered in the Flora Croatica Database (Topić 2011). This observation (confirmed by us from photographic material; Topić pers. comm.) constitutes the first reliable record for the country.

Czech Republic

Carex cespitosa is rather scattered in the Czech Republic. The first reliable records in the country are from the late 19th and early 20th centuries (Čelakovský 1867; Oborný

Table 1. Summary of the distribution of *Carex cespitosa* in Europe W of the former USSR, based on herbarium records and reliable bibliographic data (see text for details). Countries where the occurrence is questionable are indicated by a question mark (?). When the number of confirmed extant populations is given as “undetermined” it most probably implies more than 20 populations. Bosnia and Herzegovina is excluded (doubtful occurrence based on a single herbarium voucher of unconfirmed identity).

Country	Regions	First published record	Number of confirmed extant populations	Conservation status
Albania	NE Albania	2011	1	not assessed
Austria	mainly E Austria, rare in Salzburg, upper Austria, Styria and Carinthia	late 19th century	undetermined	EN
Bulgaria	Yambol and Sofia	1974	3	not included
Croatia	NW Croatia	1930	1	not assessed
Czech Republic	scattered	1867	undetermined	NT
Denmark	scattered in Jutland and Zealand	19th century or before	24	LC
Finland	widespread	19th century or before	undetermined	not included
France	scattered in Massif Central and Jura, rare in E Pyrenees	19th century or before	undetermined	LC
Germany	widespread, but only common in the north and southwest	19th century or before	undetermined	VU
Hungary	scattered	1891	undetermined	EN
Italy?	Friuli-Venezia Giulia	second half of 20th century	–	not included
Montenegro?	Durmitor Massif	1933	–	not included
Netherlands	Drenthe and Overijssel	1974	2	“sensitive”
Norway	widespread in S Norway and Troms, rare in Sør-Trøndelag	19th century or before	undetermined	NT
Poland	widespread	19th century or before	undetermined	not included
Romania	Carpathians	1866	undetermined	not included
Serbia?	scattered	1976, probably before	–	not included
Slovakia	scattered	probably 19th century	undetermined	VU
Slovenia?	SE Alps	early 20th century	–	not assessed
Spain	W Pyrenees	2007	2	CR
Sweden	widespread	18th century ¹	undetermined	not included
Switzerland	Jura	1999 (1853 ²)	undetermined	VU
United Kingdom	East of England	2012	1	not assessed

1 Described by Linnaeus (1753), implicitly including Sweden in the list of polynomials.
2 Cited by Godet (1853) but excluded by Welten & Sutter (1982); rediscovered by Cosson & Morcrette (1999).

1883–1886; Podpěra 1930). Localities are known almost all over the country, but the abundance of the species appears to be widely variable in different regions. Approximately 600 records are databased for the forthcoming Flora of Czech Republic (Grulich & Řepka, unpubl. ms.). This species prefers middle altitudes in relatively continental climatic conditions, like those in S Bohemia and SSW Moravia (Grulich 1990), where it can ascend to 1000 m a.s.l. in the Šumava Mountains. Some localities are situated in lower, warmer parts of C Bohemia and Moravia. The species is quite rare in W and E parts of Bohemia, in the Bohemian-Moravian Highlands, and in the E part of Moravia.

Although many sites for *Carex cespitosa* have been destroyed, the species is not particularly threatened in the Czech Republic. It is able to tolerate mowing (Hájková & Hájek 2007), and also a certain degree of reforestation (e.g. semi-shaded conditions below *Alnus*; Chytrý & Vicherek 1995). Therefore *C. cespitosa* is listed on the

Red List of Czech vascular plants (Grulich 2012; see also Danihelka & al. 2012) as a taxon of lower risk under the category Near Threatened (NT).

Denmark
Carex cespitosa was formerly known from numerous localities throughout most of the Danish mainland (including North Jutlandic Island) and Baltic territories (Funen, Zealand and Bornholm) (Wiinstedt 1943; Hultén 1950), but due to agricultural expansion it has become rare (Løjtnant & Worsøe 1993). At present only eight localities are known in Zealand and 16 in Jutland (Naturbasen 2013).

Despite the apparently clear decline in the populations of the species, *Carex cespitosa* is listed as Least Concern (LC) on the Danish Red List (DMU 2007).

Finland
Carex cespitosa is widespread and locally common in

the N part of Finland, while less frequent in the south (Hultén 1950). It is therefore not included on the Red List of Finnish species (Rassi & al. 2010).

France

Carex cespitosa has attracted the attention of French botanists due to its scarceness and, therefore, its distribution and conservation status have been very well studied, documented and brought up to date. It is distributed through the mountain systems of the Jura, Massif Central and Pyrenees, in C and S France, in the regions of Alsace, Franche-Comté, Auvergne and in the E Pyrenees (reviewed in Olivier & al. 1995 and Duhamel 2004). It appears to be relatively frequent at least in the Massif Central (Tort & al. 1988; Olivier & al. 1995; CHLORIS 2010) and rather common in Franche-Comté (Gillet & al. 1980; Prost 1992; Cosson & Morcrette 1999; Ferrez & Guyonneau 2005). However, it is only known from a single location in both the E Pyrenees (Villeneuve; cf. Terrisse 1994) and Alsace (étang d'Hirsingue; cf. Issler & al. 1965; Schultze-Motel 1968).

It is listed as Least Concern (LC) for the French territory (FCBN and MNHN 2012).

Germany

Carex cespitosa is widely distributed throughout Germany. However, Schultze-Motel (1968) noted that it is only relatively common in the N and the SW (Baden-Württemberg). In the N half of the country, *C. cespitosa* appears in Schleswig-Holstein and Mecklenburg-Vorpommern. It is quite rare in Sachsen and Thüringen, almost absent in the NW lowlands (BfN 2005), and reported as extinct in Nordrhein-Westfalen (Wolff-Straub & al. 1999). From C Germany southwards, it can be found mainly in the Swabian Jura and upper Neckar and Danube basins (Höller 1964; Sebald 1998; Schönfelder & Bresinsky 1990).

The national Red List considers *Carex cespitosa* as Vulnerable (VU) (Korneck & al. 1996).

Hungary

The first record of *Carex cespitosa* in Hungary was made by A. Waisbecker in 1891, from the foot of the Kőszeg Mountains (W Hungary). This classic locality still exists and the species is dominant there (A. Mesterházy, pers. obs.). Later, the species was recorded by Szodfridt-Tallós (1965) from the Őrség region (W Hungary), where it has recently been collected (A. Mesterházy, pers. obs.). Only one small population was known from the Dunántúli-Mountain Range (Szodfridt-Tallós 1962; confirmed by Lájér 2003). Scattered occurrences are known from Nyírség (Lájér 2003) and the Északi mountain range in NE Hungary (Bükk Hills, Upponyi Hills, Aggtelek Karst; Sulyok-Schmotzer 1999; Penksza-Salamon 1997a, b).

Due to its rarity, the latest national Red List of Hungary considers the species to be Endangered (EN) (Király 2007).

Italy

Carex cespitosa was recorded for Italy in Flora europaea (Chater 1980) and Flora d'Italia (Pignatti 1982). In the most updated checklist of Italian plants (Conti & al. 2005), it was reported from the N regions of Piemonte, Lombardia, Friuli-Venezia Giulia and Liguria. Despite this alleged distribution, no Italian *C. cespitosa* specimen could be found during intensive searches in the collections of the main Italian herbaria (BERG, BOLO, FI, PA, RO and TO). Personal communication with the curators and staff from BOZ, GDOR, GE, MSNM, ROV and UVV was also without any positive result. The erroneous early use of the binomial *C. cespitosa* and the frequent confusion with similar species could help to explain this situation (Pignatti 1982). In fact, all the material labelled as *C. cespitosa* in these herbaria belongs to closely related species from *C. sect. Phacocystis*. Accordingly, the species has already been excluded from the Piemonte flora (Jiménez-Mejías & Selvaggi 2011).

To our knowledge, the only reliable reference to the presence of *Carex cespitosa* in Italy seems to be an old sheet from South Tyrol (Friuli-Venezia Giulia; NE Italy) in W ("Bolzano, com. P. Gredler"; Wallnöfer 2004). Nonetheless, the possibility of label misplacement cannot be excluded. In addition, Schultze-Motel (1968) also recorded *C. cespitosa* for the Italian Tyrol ("Cadore, Ampezzo, Unter-Friaul"). More fieldwork is necessary in these NE regions where the occurrence of this species could be likely.

The species is not included on the Red and Blue List of the Italian flora (Pignatti & al. 2001).

Montenegro

The only reported occurrence of *Carex cespitosa* in Montenegro is in the lake Riblje Jezero of Mount Durmitor ("In uligin. ad lac. Riblje jezero sub. m. Durmitor; Pantoček", see Rohlena 1942). Hayek (1933) indicated this species for Montenegro probably based on the same record. However, this locality has never been confirmed, and indeed *C. cespitosa* is not in the plant checklist from this locality (Birks & Walters 1972). Additionally, the material studied from this locality was unequivocally classified as *C. acuta* (8 Jul 1989, Stevanović & Jovanović, BEOU; 15 Jul 1991, Jovanović & al., BEOU). We therefore consider the occurrence of *C. cespitosa* in Montenegro as doubtful.

Netherlands

At least three reliable locations have been reported for *Carex cespitosa* in the Netherlands, two of them in the province of Drenthe and the other one in Overijssel (De Boer 1974; Mennema & al. 1980). Older records are considered to be incorrect (Kern & Reichgelt 1954). The species is currently still known from the two northernmost sites in Drenthe (J. Koopman, pers. obs.).

On the Red List of the vascular plants of the Netherlands (Ministry of Agriculture, Nature and Food Qual-

ity 2004) *Carex cespitosa* is listed under the category “sensitive”, without a clear equivalence with the IUCN criteria.

Norway

Carex cespitosa is a rare and scattered plant across most parts of Norway, although it can be locally common and sometimes dominant in the vegetation near the inner parts of the Oslofjord (S Norway), and in the Norwegian far north (Troms, Finnmark). South of the Arctic Circle, it is found mainly E of the Scandinavian Mountains, with the exception of the apparently disjunct populations from Sør-Trøndelag (CW Norway; Hultén 1950). Our revision revealed an old voucher from the county of Møre og Romsdal, close to the Sør-Trøndelag border (see Appendix 1).

On the Norwegian Red List of plants *Carex cespitosa* is included as Near Threatened (NT) (Solstad & al. 2010).

Poland

Carex cespitosa is apparently common in Poland when compared with more W and S European countries. Therefore only 14 vouchers from Poland were studied. It is scattered throughout the country and is often common in bogs and peat-meadows (Zajac & Zajac 2001). It is therefore not listed on the Red List of Polish plants (Każmierczakowa & Zarzycki 2001).

Romania

The first reference to *Carex cespitosa* in Romania dates back to the 19th century (Schur 1866, as *Vignantha “Dreyeri”*) and is placed very close to the town of Sibiu (“Narzissenwiese im jungen Wald bei Hermannstadt”). This locality is confirmed by herbarium vouchers deposited in BP and SIB, but it seems that the wet grasslands in which *C. cespitosa* occurred around Sibiu disappeared more than a century ago (Drăgulescu 2008). Since then, the species has been found in several other locations, mainly from intra-mountainous depressions, valleys or foothills of the Carpathian range (see Appendix 1). Herbarium revision revealed frequent misidentifications of *C. elata* or *C. nigra* vouchers as *C. cespitosa*. Therefore, we consider that the abundance of this species in Romania, as reported in older botanical literature, is probably overestimated.

Carex cespitosa is not listed on the Red List of Romanian species (Sârbu & al. 2007).

Serbia

Carex cespitosa is recorded from several regions in the Flora of Serbia (surroundings of Beograd and Kragujevac, Cer and Plješevica Mountains, as well as Deliblatska peščara in Vojvodina; Jovanović-Dunjić 1976; see also the text for Croatia above). However, the in situ study of the collections deposited at BEO, BEOU (Belgrad) and BUNS (Novi Sad) did not confirm the occurrence in Serbia of this species, which thus remains doubtful.

Slovakia

Carex cespitosa is scattered but not common in Slovakia. It seems to be absent in the warmest parts in S Slovakia. Most populations are known from the Záhorská nížina lowland in the westernmost part of the country and from the Carpathian valleys in C and N Slovakia (Hájková 2007).

In the last edition of the Red List of Slovakian flora *Carex cespitosa* was evaluated as Vulnerable (VU) (Feráková & al. 2001).

Slovenia

Although Schultze-Motel (1968) listed *Carex cespitosa* for several regions of Slovenia (Koroška – Carinthia, Gorenjska – Upper Carniola, and Primorska – Slovenian Littoral), most of them correspond to territories currently in Austria and Italy, respectively (see ethnic regions considered by Mayer 1952). More recently, Martinčič (2007) only listed the Karavanke Mountains, although the identity of this record is unclear (A. Martinčič, pers. comm.). It is likely to be based on a note by A. Paulin in his edition of the Austrian flora (Križe near Tržič [Gorenjska]; Hayek & Paulin 1907). There is an additional record from Obrov in Primorska (Poldini 1980). However, none of the records is supported by herbarium material at LJU or other herbaria. Therefore, the occurrence of this species in Slovenia remains questionable, although fairly probable given the proximity of some Hungarian populations (Szentgyörgyvölgy; see Appendix 1).

Spain

On the Iberian Peninsula, the presence of *Carex cespitosa* has been reported recently by Jiménez-Mejías & al. (2007) and subsequently recorded in Flora iberica (Luceño & Jiménez Mejías 2008). It is based on a single location in the Pyrenees along the N-facing Bidasoa river, in the Navarra region close to the French border. This population was previously misidentified as *C. elata* s.s. (cf. Luceño & Aedo 1994). Herbarium revision has revealed a second population in Sarries, in the Navarra region as well (see Appendix 1). This population is located in a S-facing valley in the River Ebro basin, 65 km S from the other known population. The Spanish populations constitute the westernmost limit of the global distribution of the species.

Carex cespitosa is listed on the Red List of Spanish vascular flora (Moreno & al. 2008) as Critically Endangered (CR).

Sweden

Carex cespitosa is widespread and locally common in C Sweden (Almqvist 1929; Malmgren 1982; Genberg 1992; Rydberg & Wanntorp 2001; Bertilsson & al. 2002), while rarer in the north (Danielsson 1994) and south (Sterner 1986; Edqvist & Karlsson 2007; Tyler & al. 2010). In this latter region, it is extinct in the Dal (Andersson 1981) and Blekinge districts (Fröberg 2006).

Carex cespitosa is not listed on the Red List of Sweden (Aronsson & al. 2010).

Switzerland

Carex cespitosa has recently been rediscovered in Switzerland (Jura mountains, Vaud and Neuchâtel cantons; Cosson & Morcrette 1999; Morcrette & al. 2002; Druart 2004). It was first recorded from Neuchâtel in the 19th century (Godet 1853), but subsequently excluded from the Swiss flora (Welten & Sutter 1982; Moser & al. 2002). Populations from the Swiss Jura are located in the Upper Doubs basin and environs, like those from the French Franche-Comté (see under France above; Cosson & Morcrette 1999). We have detected additional herbarium vouchers from Bern and Schaffhausen cantons (see Appendix 1), not far from the populations in the Swiss and German Jura mountains. Due to the rarity of the species, the persistence of these populations should be checked.

The national conservation status for *Carex cespitosa* in Switzerland is Vulnerable (VU) (Druart 2004).

United Kingdom

Carex cespitosa was excluded from the account of *Cyperaceae* for the British Isles by Jermy & al. (2007), who attributed all previous records to misidentifications. However, we found a reliable herbarium voucher of this species from E England (Hertfordshire: near West Mill, near Buntingford, 26 May 1960, *Dony 3815*, BM). The persistence of this population was recently confirmed; it is composed of about 300 tussocks approximately 2.5 km S of the original record in a spring-fed mire (James & al. 2012).

Due to its recent discovery in the United Kingdom, *Carex cespitosa* has not yet been included on any official list of endangered plants. The existence of a single known population could lead to its being considered as Critically Endangered (CR) (James & al. 2012).

2. Hybrids

Koopman (2011) reported seven hybrids of *Carex cespitosa* for the whole of Europe. In our study area, the following three hybrids of *C. cespitosa* with species of *C. sect. Phacocystis* have been found. Specimens studied are listed in Appendix 2.

1. *Carex cespitosa* × *C. acuta*

Carex xallosepis Rchb., Icon. Fl. Germ. Helv. 8: 233, t. 586. 1846.

This hybrid has been doubtfully recorded by Schultze-Motel (1968) from N Germany, and later confirmed by Kiffe (2001a) from the SW of the country. It has also been recorded recently from Finland, France, Norway, Russia, and Sweden by Koopman (2011). We have studied a single specimen from Austria (see below).

It can be distinguished from *Carex cespitosa* by the

longer spikes and the lowest bract, which is as long as or slightly longer than the inflorescence, while shorter in *C. cespitosa*. Regarding *C. acuta*, the hybrid is smaller in all its parts and has well-preserved, apparent, orangey, entire basal sheaths, instead of the brown, leaf-like, frequently inconspicuous and disintegrating basal sheaths typical of *C. acuta*. This hybrid plant strongly resembles the relatively frequent hybrid between *C. acuta* and *C. nigra* (*C. xelytroides* Fries.; see Jermy & al. 2007 for a detailed description), although the two can easily be separated because this latter has amphistomatic leaves, whereas *C. xallosepis* is entirely hypostomatic).

2. *Carex cespitosa* × *C. elata*

Carex xstrictiformis Alm. in Hartman, Handb. Skand. Fl., ed. 11: 469. 1879 = *Carex xfrankii* Podp., Vestn. Klubu Prír. v Prostejově 10: 6. 1908, nom. illeg. [non Kunth 1837].

This hybrid has previously been recorded from Germany (Schultze-Motel 1968; Kiffe 2001a, b) and Austria (Melzer 1988), and more recently from the Czech Republic, France, Italy and Sweden (Koopman 2011). It is easily identified due to its clearly intermediate morphological characters, both quantitative and qualitative, between the two parental species: leaves hypostomatic; basal sheaths enlarged, reddish, brown-reddish or yellowish-brown, sometimes with a ladder-fibrosille structure; male and female spikes show an intermediate length, generally longer than those in *Carex cespitosa* (20(–30) mm); utricles are faintly nerved or nerveless, with the inner side reddish.

3. *Carex cespitosa* × *C. nigra*

Carex xbolina O. Lang in Linnaea 24: 551. 1851 = *Carex xperaffinis* Appel in Jahresber. Schles. Ges. Vaterl. Cult. 1891(2): 158. 1892.

This hybrid has been recorded from the Czech Republic, Finland, France, Germany, Italy, Norway, Poland, Slovakia and Sweden (Schultze-Motel 1968; Kiffe 2001b; Koopman 2011). It is more variable than the previous ones, probably due to the highly variable morphology of *Carex nigra*.

The main diagnostic character is the amphistomatic leaves, therefore combining the feature from the hypostomatic *Carex cespitosa* and the epistomatic *C. nigra*. Rhizomes vary from densely caespitose to rhizomes with more or less enlarged internodes. Basal sheaths are mainly reddish, more labile than in *C. cespitosa*, and sometimes breaking up as in *C. nigra*. Utricles are suborbicular, faintly nerved or nerveless.

The name *Carex sororia* Meinsh. has been applied to hybrids between *C. cespitosa* and *C. nigra*. However, careful examination of the type collection (at BM and K) revealed no evidence of hybrid origin. Indeed, the specimen at BM is rather typical *C. cespitosa*. Thus, we lectotypify *C. sororia* on the BM specimen, and the name is to be considered a mere synonym of *C. cespitosa*.

Carex sororia Meinsh., Fl. Ingr.: 404. 1878, nom. illeg. [non Kunth 1837] – **Lectotypus (designated here):** [Russia], “In turfosis regionis ad fl. Siworkam pr. Gatschinam”, Jun 1872 [Herbarium Fl. Ingricae 723, Cent. X] (BM 001067141 photo!; isolectotypus: K 000960440!).

3. Ecology

Even omitting the fact that the ecology of *Carex cespitosa* has been somewhat blurred mainly by its confusion with other plants (e.g. reported as a species of *Molinio-Juncetea* by Soó 1973 in C Europe, due to a misidentification with *C. elata*), its ecological preferences seem to be indeed wide when viewed in a European context. The habitats reported by the extant reliable records and herbarium vouchers (see Appendix 1) indicate in all cases a dependence on water, ranging from flooded ground to damp soil or underground water, probably in most (or all) cases with a high peat content and mesotrophic conditions, and in both open grasslands or more or less canopy-closed river forests. Thus, *C. cespitosa* can be found in swampy peat bogs (Tort & al. 1988; Ferrez & Guyonneau 2005), mires (Lájer 2003), and river beds (Jiménez-Mejías & al. 2007), but also commonly in not strictly aquatic habitats such as wet meadows and megaphorbic communities (Höller 1964; Morcrette 2000; Ferrez & Guyonneau 2005; Stoeva & al. 2005), and in some cases, areas subject to flooding by rivers (see Höller 1964; De Boer 1974). A preference for calcareous soils has been mentioned (e.g. James & al. 2012), but it seems to be rather inconstant.

Due to this ecological plasticity, *Carex cespitosa* is able to survive fluctuations and some degree of disturbance, such as grazing (James & al. 2012), or forest colonization as a result of ecological succession (e.g. by *Alnus*; Chytrý & Vicherek 1995).

4. Conservation status

The wide global distribution of *Carex cespitosa* across the Palearctic makes it difficult to apply the IUCN Red List conservation categories and criteria at the global level (IUCN 2012). Nonetheless, it appears highly unlikely that the species would fulfil some of them (i.e. very large extent of occurrence and area of occupancy for criterion B, unknown but surely above threshold total number of individuals for criteria C and D). For criterion A, the degree of reduction in population size is also unknown and difficult to estimate given the distribution of the species, although the presence of the species appears to have been considerably diminished in many European countries due to anthropogenic influences. Therefore, although the global conservation status of *C. cespitosa* is probably Least Concern (LC), conservation studies at country level and below appear advisable (IUCN 2012). Indeed, the species has been included under one of the threatened – or near threatened – categories in eight out

of the 19 countries for which we have confirmed its presence: Near threatened (NT) in the Czech Republic and Norway; Vulnerable (VU) in Germany, Slovakia and Switzerland; Endangered (EN) in Austria and Hungary; and Critically endangered (CR) in Spain. In the Netherlands the plant is considered as “sensitive”, indicating a certain degree of threat, and reports of decline have been given for Sweden. In only two cases – Denmark and France – is it explicitly considered as not threatened (Least Concern – LC). For Albania, Bulgaria, Croatia, Finland, Poland, Romania, Sweden and the United Kingdom it is not included in the national Red Lists. In the cases of Albania, Croatia and the United Kingdom its absence from the lists is due unequivocally to its recent discovery. The Bulgarian and Danish cases need revision, especially the latter, given the clear decline of the species in Denmark (see above).

5. Conclusions

Carex cespitosa occurs mostly scattered and is typically a rare plant in many European countries, especially in W and S Europe. The presence of the species is confirmed in 19 European countries. In each of Albania, Croatia and the United Kingdom only one extant population is known; in both the Netherlands and Spain only two; in Bulgaria only three. In Switzerland it is mostly restricted to the Jura Mountains. It is more widely distributed in France, where it inhabits three mountain systems: the Jura, the Massif Central, and the E Pyrenees, although it is very scarce in the last mentioned, with a single station. In Scandinavia and C Europe, its distribution seems to be more continuous, although in Denmark it appears to have disappeared from many places. The presence of *C. cespitosa* in Bosnia and Herzegovina, Italy, Montenegro, Serbia and Slovenia is in need of confirmation and further field work is necessary.

Although chorological revisions in Europe are commonly neglected as minor works of little relevance, the divergence between the situation depicted by the literature for *Carex cespitosa* and the actual one detected by our study highlights the importance of, and the need for, these basic works for the accurate knowledge of many species, especially for those threatened, rare or declining.

Acknowledgements

The authors wish to thank M. S. Porter and an anonymous reviewer for their critical comments that greatly contributed to improve the quality of the manuscript, and N. Turland for his editorial work; F. J. Fernández for technical support; the curators and staff of the herbaria visited (BEO, BEOU, BM, BUNS, CL, FI, K, M, MSB, P, RO, SO, SOM, TO and UPOS) for all the help provided during the study of the collections, especially A. Asenov and O. Vasić for help with transcriptions from

Cyrillic; the curators and staff from B, BASBG, BBF, BREM, CHE, G, JE, L, LI, LISU, MA, O, SANT, STU, W and ZT for the kind loan of specimens, especially M. Baltisberger for his help with handwritten labels; the curators and staff of BERG, BOLO, BOZ, BP, BUCA, BVS, CRAI, GDOR, GE, I, IAGB, IASI, LJU, MSNM, PA, ROV, SARA, SIB and UUV for checking the presence of *Carex cespitosa* among their collections; M. Jaźwa for providing us with scans of *C. cespitosa* material from KRA; M. Fernández-Mazuecos for his kind support with the preparation of figures; J. E. Rodríguez for invaluable technical support during the visit to the Munich herbaria; A. Alegro, F. Bogunić, A. Martinčič, D. Petrović and B. Wallnöfer, for useful discussions about the presence of *C. cespitosa* in Bosnia and Herzegovina, Croatia, Slovenia, Montenegro and South Tyrol (Italy), respectively; J. Topić for kindly providing photographic materials of the single known Croatian population of *C. cespitosa*; M. Luceño and C. Pachschwoell for sending us photographs of *C. cespitosa* and granting us permission to reproduce them in this publication.
