

Supplemental material for

“A First-order Method to Identify Potentially Dangerous Glacial Lakes in a Region of Southeastern Tibetan Plateau,” by Weicai Wang, Tandong Yao, Yang Gao, Xiaoxin Yang, and Dambaru Ballab Kattel; published in *Mountain Research and Development* (MRD) vol 31 no 2 (May 2011).

APPENDIX S1 Potentially very highly dangerous glacial lakes ($P>0.8$) identified in our study area and their corresponding parameters (8 glacial lakes). Lake area uncertainties are obtained with a shoreline length multiplied by half a cell resolution of the ALOS image. Also shown are the characteristics of 6 drained glacial lakes obtained from topographic maps and corresponding DEMs.

Lake ID	Latitude	Longitude	Altitude/m	Lake area /km ²	Mother glacier area /km ²	Distance to mother glacier/m	Slope between lake and glacier/°	Mean slope of moraine dam/°	Mother glacier snout steepness/°	Total value (P)
